# Hamilton Airshed Modelling System: Sub-Regional Analysis

*Anthony Ciccone Ph.D., P. Eng. And Janya Kelly Ph.D.  
26 November, 2018*

**CITY OF HAMILTON**

# Acknowledgements

Golder would gratefully like to acknowledge the following contributors to the project:

- Jim Wilkinson, Ph.D.
- Barron Henderson, Ph.D.
- Environment and Climate Change Canada
- Stakeholder Advisory Committee
  - HIEA
  - Public Health
  - Community Stakeholders

# Project Objectives

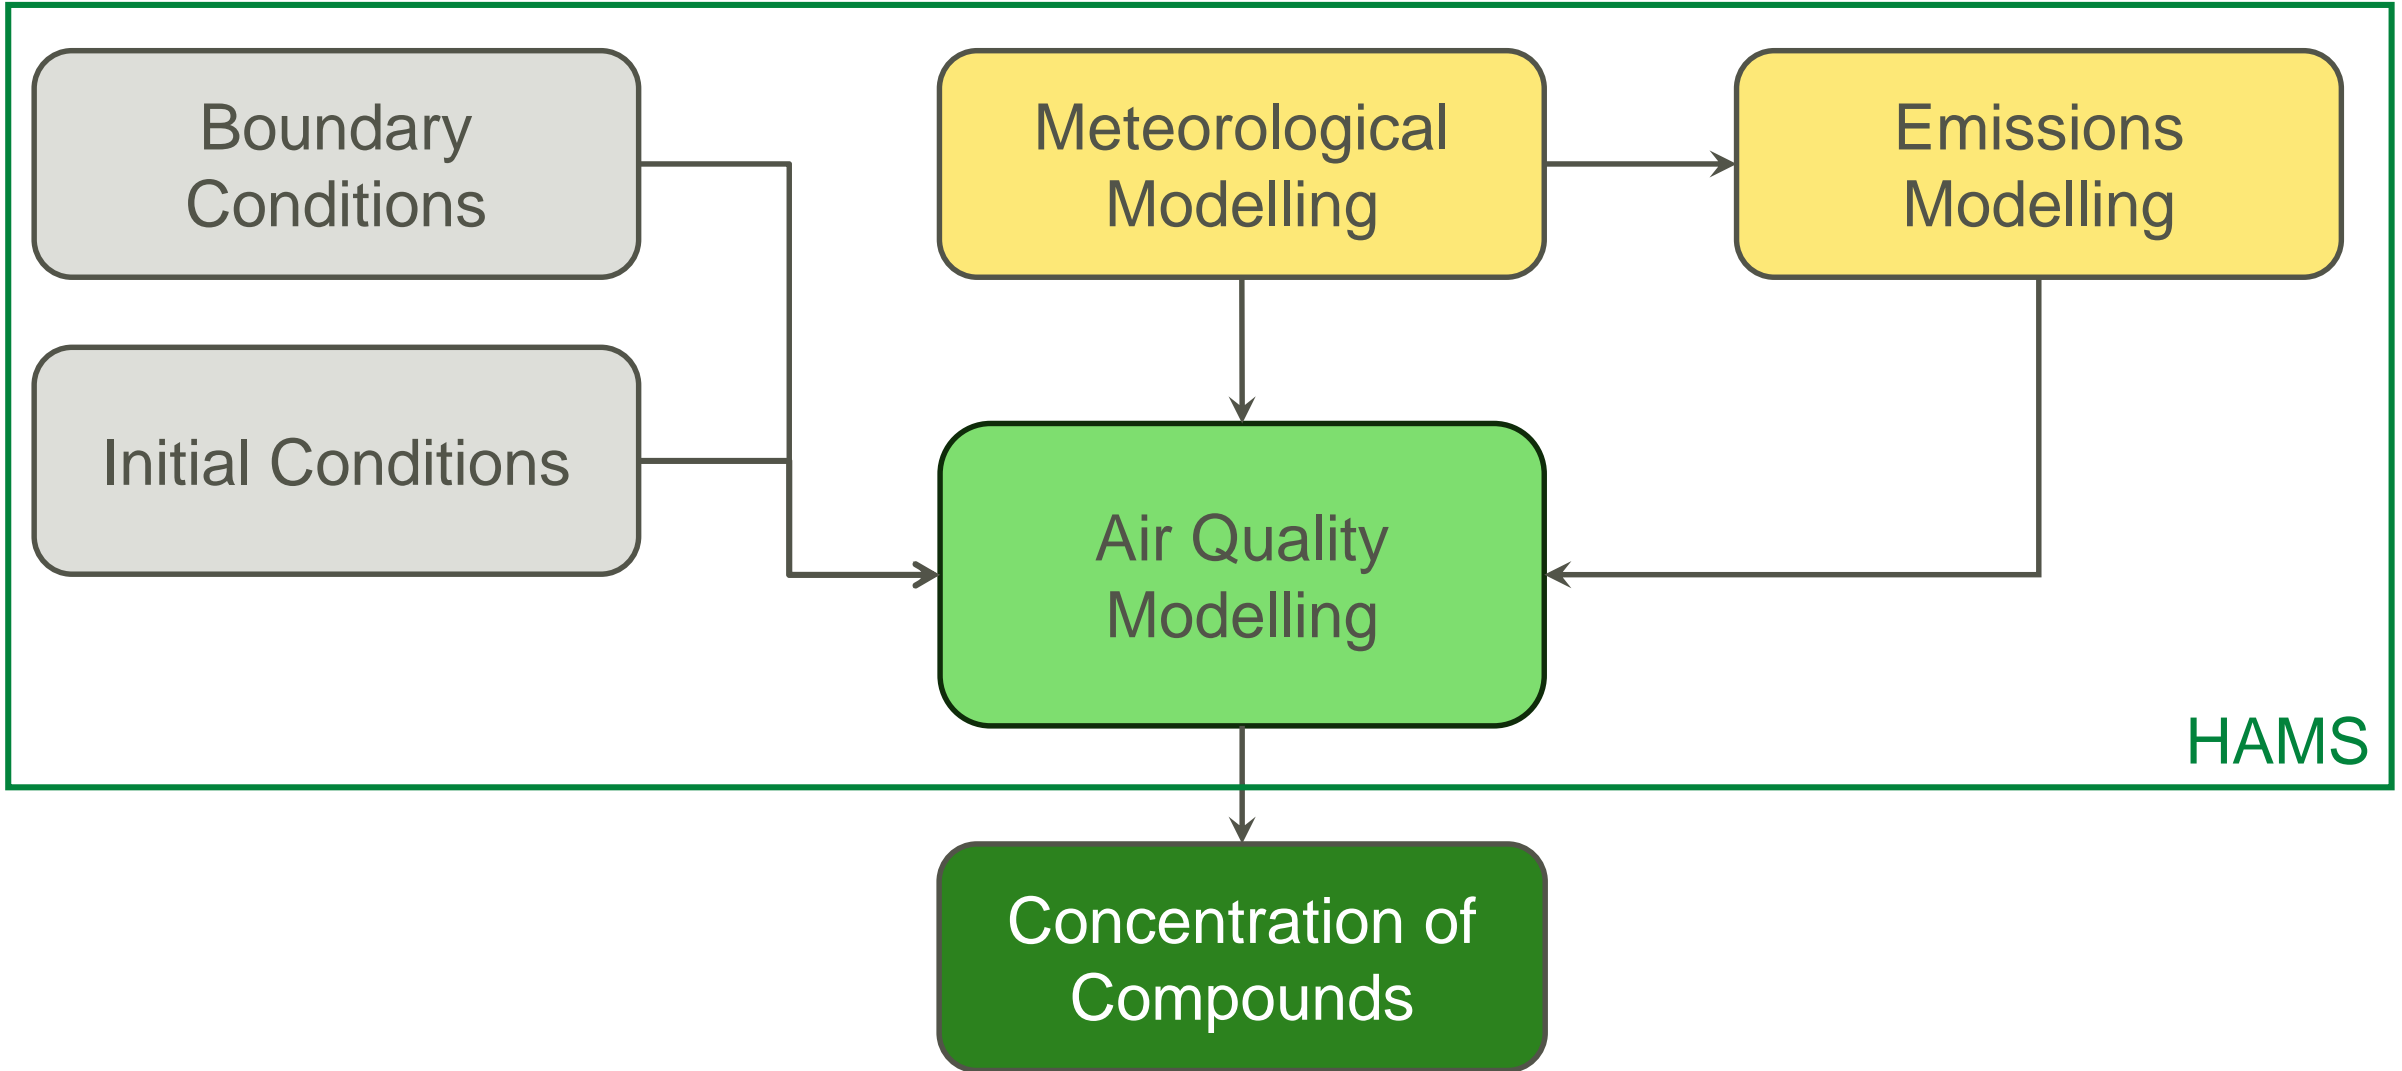

## Challenges: The Hamilton Airshed Puzzle

- Who? What? Where? and How much contributes to air quality?
- Are levels different in different parts of the City?
- How much is local?
- What is the influence of the USA or outside geographies on Hamilton?

## Solution: Hamilton Airshed Modelling System (HAMS)

- Built on understanding of the current state of the science
- Relies on local data as well as transboundary (e.g. land use, roadways, trains, industry, agriculture)
- Handles complex meteorology (e.g. lake effects and escarpment)
- Considers atmospheric chemistry – important part of the puzzle
- Needs a Big computer

# Hamilton Airshed Modelling System

# Compounds of Interest

## Studied Compounds\*

Acrolein	Ozone
Ammonia	Volatile Organic Carbons
Benzene	Benzo(a)pyrene
Butadiene 1,3	Cadmium
Carbon Monoxide	Chromium (III)
Formaldehyde	Chromium (VI)
Nitrogen Oxides (NO <sub>2</sub> and NO)	Lead
Sulphur Dioxide	Manganese
PM <sub>10</sub>	Mercury
PM <sub>2.5</sub>	Nickel

*\*Please note additional species, including precursors, are available but were not studied*

## Presented Compounds\*

PM <sub>2.5</sub>
PM <sub>10</sub>
Nitrogen Oxides
Sulphur Dioxide
Ozone
Benzene
Benzo(a)pyrene

*\* Selected by the Stakeholder Advisory Committee*

# Grid Density: All Tiers

Tier
Tier I (36 km)
Tier II (12 km)
Tier III (3 km)
Tier IV (1.33 km)

# Selected Urban Regions

Regions	Influence
IC = industrial core	Industry, port, rail, roads
WL = west lower	Road, non-road
EL = east lower	Industry, road, non-road
WU = west upper	Road
EU = east upper	Road

Figure 1 in Radisic, S., Newbold, K. B., Eyles, J. and Williams, A. (2016). Factors influencing health behaviours in response to the air quality health index: a cross-sectional study in Hamilton, Canada. *Environmental Health Review, Volume 59(1), 17-29.* DOI: 10.5864/d2016-002

# Model Verification

# Model Verification

## MODEL PERFORMANCE EVALUATION SUMMARY

- The results meet published benchmarks which provides confidence in the results of the modelling simulations.
  - Meteorology benchmarks met for temperature, mixing ratio, wind speed and wind direction
  - Particulate matter met performance criteria
    - PM<sub>10</sub> is under-predicted likely due to unaccounted for fugitive dust source
  - All compounds are predicted within a factor of 2
    - Performing within expectations of the modelling community
  - Transboundary NO<sub>2</sub> emissions are overstated leading to model over-prediction
  - Metrics for benzene and B(a)P could be impacted by lack of observations (compared to other species)
- Hamilton Airshed Modelling System provides conservative and reliable results with a strong degree of confidence

# Emissions Inventory Results

# Emissions Inventory Sources

## GRIDDED, HOURLY EMISSION ESTIMATES BY TIER

Emission Classification	Type	Definition	Source	
			Tier I	Tiers II – IV
Industrial	Point (all tiers)	Elevated stacks from industrial activities	2006 Canadian National Emissions Inventory (NEI) 2011 US NEI	2012 NPRI, 2011 US NEI
	Area	Industrial activities		2012 NPRI, 2011 US NEI
Commercial	Point (Tier I, US Only)	Natural gas usage, auto-body shops, dry cleaners, commercial solvents		2012, ChemTRAC (scaled by population), 2012 Stats Can population data, 2011 US NEI
	Area			2012 natural gas consumption, 2012 Stats Canada energy use, 2011 US NEI
Residential	Area	Natural gas usage, other residential heating sources		2012 MOVES, 2012 MTO traffic data, 2011 US NEI
On-Road	Area	On-road vehicles (trucks, cars, motorcycles)		2006 Canadian NEI, 2012 NRCAN data, 2011 US NEI
Non-Road	Point (Tier I, US Only)	Airport, marine, rail and lawn mowers,		2012 MEGAN, 2006 Canadian NEI, 2011 US NEI
	Area			
Biogenic / Agricultural	Area	E.g., natural, farmland

Annually Averaged Source Contribution: Benzo(a)pyrene

# Conclusions

## WHAT HAVE WE LEARNED FROM THE HAMILTON AIRSHED MODELLING SYSTEM?

- Source contribution varies according to geographic location (i.e. domain average different from industrial core)
- The industrial core (IC) and western lower (WL) regions consistently experience the highest concentration of pollutants, much higher than the domain average
- Compared to the domain average, transportation related activities are more significant
- Strong transboundary contribution to  $PM_{2.5}$  and  $PM_{10}$  remains
- On-road  $NO_2$  sources have a higher contribution than other sources but controlling  $NO_2$  locally will impact the ozone concentrations
- Rail emissions dominant contributor to  $SO_2$  levels in WL region
- Outside of IC, industrial contribution to air quality shows a significant drop for benzene and B(a)P
